Ok. Found one. Simpler.

Download upp-2008.1-1.src.rpm from here: http://dl.free.fr/jdy1GSwDF

Then create your rpmbuild environment:

cat > ~/.rpmrc << EOF
buildarchtranslate: i386: i586
buildarchtranslate: i486: i586
buildarchtranslate: i586: i586
buildarchtranslate: i686: i586
EOF

cat > ~/.rpmmacros << EOF
%_topdir $HOME/rpm
%_tmppath $HOME/rpm/tmp
%distribution Linux
%vendor Ultimate++ team
%packager YourName YourLastName <youremail@provider.loc>
EOF

For next command, please, remove the space between for tmp (shouldn't be "t mp}" but when I
"Apply message changes" the space is back again:

mkdir -p   ~/rpm/{BUILD,RPMS/{i586,x86_64,noarch},SOURCES,SRPMS,SPECS,t mp}

Now, build the rpm source file:

rpmbuild --rebuild upp-2008.1-1.src.rpm
