I recently have to deal with existing database (not created from .sch file).

To make things easier, I have added these utility functions to Sql:

```
String ExportSch(SqlSession& session, const String& database);  
String ExportSch(const String& database);
```

- exports the database to .sch format

```
String ExportIds(SqlSession& session, const String& database);  
String ExportIds(const String& database);
```

- exports table and column names as SQLID (or new SQL_ID(id, sqlid) to deal with case sensitivity in mysql).

Mirek
