As far as I know, you can't use a reference to a non-moveable type as a parameter to a callback.

You could pass it as a pointer, but I would suggest adding a reference member to ItemNotes:

.h:

```
class ItemNotes : public WithItemNotes<TopWindow> {  
    typedef ItemNotes CLASSNAME;
```

```
        Download_Manager_Window &download_manager_window;
```

```
    ...
```

```
};
```

.cpp:

```
ItemNotes::ItemNotes(int item_id,Download_Manager_Window &_download_manager_window) :  
download_manager_window(_download_manager_window)
```

```
{
```

```
// Constructor
```

```
}
```
