Subject: Re: Does the provided upp.spec works for you and on which distro?

OK, I replaced %make with make (what does %make mean?), and he two dependencies, and deleted xft2-devel as a dependency (it seems my distro includes it in x11 devel package).

Build went pretty well, expect that it lasted an incredibly long time. I could have built about 10% of a kernel in that time .

There are still some small problems. Rpmbuild tries to copy files to %{buildroot}, but it actually takes it verbatim and files wind up in "~/rpm/BUILd/upp-2008.1/%{buildroot}". I believe that it should have replaced %{buildroot} with something. Must set it up somewhere.

I also got a:
Processing files: upp-2008.1-1
error: File not found: /usr/share/icons/hicolor/48x48/apps/theide.png

Shouldn't it be working with local build files instead of with my systems /usr content?

PS:
rpm -bb ~/rpm/SPEC/upp.spec
is actually
rpmbuild -bb ~/rpm/SPECS/upp.spec
for those who want to try the build process also.

PS2: What is wrong with the png? It shows up OK.
