Subject: Re: Does the provided upp.spec works for you and on which distro?
Posted by amrein on Fri, 22 Aug 2008 17:24:54 GMT

I installed Fedora 9 and OpenSuse 11.0 for testing.

I already tested Fedora and Mandriva.

The problem with %{buildroot}: in Mandriva, they already set it for you and their developers removed its definition into their .spec files. On Fedora, you need to include it.

The problem with the png: the one from the U++ tarball is a bad png. Perhaps because of svn when it was imported (not in binary form). Their is a good theide.png in the src.rpm and the rpm script use it instead.
