(UPDATED WITH LAST RPMS, THEY WORKS)

Ok, here are the rpms. They are also now on sourceforge.net too.

RPM binary Release to use (those rpms will be there for 30 days if no one download them):

Fedora 9 i386 rpm: <http://dl.free.fr/p3MvNQeEE>
(install with yum install --nogpgcheck upp-2008.1-1.fc9.i386.rpm)

Mandriva 2008.1 i586 rpm: <http://dl.free.fr/qS3GEy9wv>

OpenSuse 11.0 i586 rpm: <http://dl.free.fr/qTueoO3N8>

Mandriva + Fedora + OpenSuse source rpm: <http://dl.free.fr/jdy1GSwDF>

Build dependencies if you want to build the source rpm yourself:
(because you are running a Linux 64 bit distro or want to test...)

First, create the rpmbuild environment (see 8th post) then, before building the binary with
"rpmbuild --rebuild upp-2008.1-1.src.rpm" with your user account you need to become root and
type":

Mandriva 2008.1: # urpmi rpm-build gcc gcc-c++ gtk2-devel pango-devel atk-devel cairo-devel
expat-devel X11-devel freetype2-devel

Fedora 9: # yum install rpm-build gcc gcc-c++ gtk2-devel pango-devel atk-devel cairo-devel
expat-devel xorg-x11-server-devel freetype-devel

OpenSuse 11.0: # YaST -i patch make gcc gcc-c++ gtk2-devel pango-devel atk-devel cairo-devel
libexpat-devel xorg-x11-devel freetype2-devel
