luzr wrote on Wed, 27 August 2008 16:17Actually, I was suggesting that the ".1" is not really needed... because it is unlikely we will have another "major" release this year.

In fact, I would like to have next release sort of "ultimate", we remaining U++ issues possibly solved (see and extend "The plan...").

Mirek

I would try (if possible and it makes sense) to change+finish 1 thing from "The plan" at a time and release after each one is done.
Waiting for "ultimate" version may easily go from something like 1 year to 5-10 years, and at that point everyone will be either using svn/dev's releases as stable, or still stick to 2008.1 (unlikely).
I mean, let's find the smallest possible set of new features, which makes sense to be implemented together, do them and release. (See also "SCRUM" for reference what I feel)
While I would love version with "all issues solved", I don't believe into such things anymore. There will be always some new issue.
