
Subject: Assist autocomplete cause program crash.

I had a complex templated class with multiple inheritance:

```
template<typename T>
```

```
class MultiArg : public Pte<MultiArg<T>>, public TArg, public Vector<Value>{
```

When I use "this->" in a class method definition and the autocomplete menu attempts to show, the program crashes.

I've removed the Pte<MultiArg<T>> because it is not needed and then assist works fine and there are no crashes. While may nothave been correct to use both Pte and Vector, it shouldn't have crashed.
