Subject: Unified locking? Posted by mirek on Thu, 28 Aug 2008 13:41:59 GMT View Forum Message <> Reply to Message

Just a small idea, maybe we can officially name two methods:

EnterMutex LeaveMutex

and use them for "unified locking". I mean, if you e.g. have any type wich instances are to be locked, it should have these two methods.

We could then apply commong constructs to such objects, e.g. templated Mutex::Lock or INTERLOCKED.

For example, if CtrlCore gets traditionally MT safe, we could do

```
ArrayCtrl a;
INTERLOCKED_(a) {
}
of course, obvious utility is
template <class T> class WithMutex : T, Mutex {}
Mirek
```
