cbpporter wrote on Sat, 30 August 2008 07:43I think I understand now. When you are printing on paper, the size of an inch is constant. Thus increasing DPI, makes text smaller.

But on screen, DPI is considered PPI and the pixel size for a resolution is considered constant. By altering DPI, you actually change the size of an inch. So by increasing DPI, you increase the "virtual" inch size, and thus text gets larger.

Welcome to the real world.

That is why I keep saying that points and DPI for screen are largely irrelevant. What only matters is zoom ratio.

Mirek
