Yes, there are desktop sharing applications. I know VNC has view-only mode. So you can start VNC server and have everyone connect. I am not sure what that will be like for bandwidth though; we would probably need to use a web service to help with that.
I found this program/service through a blog posting
Dimdim
"Dimdim provides a web interface where you can host a meeting and others can join it for desktop sharing, chat and video and audio transmission. There's no cost, but also no guarantee of uptime. However, all is not lost. Dimdim also offers a paid service with a 99.9% uptime guarantee and additional features for a flat $99 per year per virtual conference room.

If you'd rather not have your transmissions go outside the office, you can run the Dimdim software yourself. Again, this is free if you run the open source version or a fee for the enterprise version. See the Dimdim Editions chart for comparison."
