EDIT: this was supposed to be reply to another post in I think different thread, but it somehow got lost/deleted/moved when I was posting this?

And you still didn't even hit the "contribute the code, get refused anyway" scenario.

Well, keep contributing with ideas, discussing them, and your target is to make Mirek believe those changes are good and important. (Or "Uno" is your second change to change something in official U++, the third member of core U++ team does not show up at forums AFAIK)
But don't expect anything happen very fast, if it does not directly suit their needs. Patience. (many of us are going trough this, with complete finished source package it is usually easier to get included into U++, and even that takes lot of time and labor, with major concept changes like your proposals the resistance will be even higher)

Also most of us do use U++ for real projects. Even if those projects are just for fun or their are commercial, but we have very specific needs, etc... most of the time we are just trying to "make it work, eventually fix it in universal way", not the opposite way.
