If you're having problems one way is to just download the source package and replace your old source.

You can then compile the updated Thelde using the old one if you desire.

It is relatively easy to have multiple versions running, especially if you don't want different Ide versions, just the source. You can do this by creating new Assemblies. Right-click the old one you wish to duplicate, selct 'New...' and change the uppsrc path to a directory with a different version in it and change the name. You can probably find more info by searching the forum.
