Excellent!

BTW, I would like to have this automated soon (and performed each night). The idea is that maintainers should control the process via svn script updates.

Do you eventually have any ideas what the infrastructure should look like?

So far, I think that there should be something like 'builders' folder in svn. Each night, user 'upp' on server should export latest svn into ~/upp.src (with subfolders 'uppsrc', 'examples' etc...). Then it would run all scripts in 'builders'. These scripts should create output packages (e.g. .debs) and upload them somewhere (either website, or googlecode or maybe both).

Any comments?

Mirek
