New product that I saw from a Digg article:

http://www.efixusa.net/product_info.php?products_id=28

Its a usb drive that allows you to install MAC OS on a pc

From their site:

Quote:Run Unmodified Mac OS X on a PC:

Boost your creativity, your dreams and daily tasks in a fully new dimension with Mac OS X on PC. Start to experience what Mac OS X users always enjoyed, stability of Mac OS X system, unique security protection, no viruses, and the beauty of the OS all on your standard PC.

Note sure how it works yet...

Update: Looks like it is limited to the hardware it can run on.
