2. E-mail client
- POP, IMAP, and SMTP support
- Filters
- Address Book
- RSS Feeds (with our new handy RssCtrl!)
- Calendar -> maybe separate project (Since Thunderbird development has halted, why not create something in its place?)

Well, I have a good news then I have almost finished a POP3Mail class. (It conforms to the RFC 1939, though no APOP or TLS, or MIME parsing yet). I was considering to upload it to the Bazaar this weekend with a simple mail reader example. Maybe someone could help me with a MIME parser and a Standard "Mail" class, before I start my own.

Hello,

I can be a beta tester. It would be very nice to have something able to run from a usb drive and able to synchronize your emails and Address Book.

I think that the first 3 steps
- POP, IMAP, and SMTP support
- Filters
- Address Book
would be a very good starting point and let the horizon to be quite visible and not very far.

Luigi

I agree, it would be nice to have that feature. As for the "horizon" I'm rather optimistic this time. As I mentioned above, I've almost finished the barebone Pop3 class. What's more is, This is a derivative of my "MailSocket" base class which can serve as a clear and familiar interface for handling the other Mail protocols. Actually, I "borrowed" code from Smtp mail (I hope no one would mind) , modified it and created a common interface for deriving other mail protocols easily.
