Subject: Almost compile on Archlinux [Install and run but need test]

hello guys, i used to be the older Archlinux's package creator for UPP, i've finally compiled it but needs some test and i have some questions.

The file GCC.bm where can i get it? i had to copy from upp 2007 and i think it's not compatible with 2008. It is no included with the src package and it doesn't generated on the compile time. If i solve this problem maybe the package runs great.

If you want to compile this PKGBUILD (Archlinux's way of building software) you have to creat a link to some libraries, 'cause i still don't know how to patch the source code to the correct direction:

ln -s /usr/lib/glib-2.0/include/glibconfig.h /usr/include
ln -s /usr/lib/gtk-2.0/include/gdkconfig.h /usr/include

Please test it or correct my mistakes.
Sorry for my bad english.
