After fixing the parser, there was a time to fix actual Assist++ (in fact, its expression evaluator)...

It was hard and difficult, but now it finally seems to work in all my testcases, including my favorite

```
String x;  
x.Right().
```

(look into String.h to see why it is so big problem

Of course, two limitation of A++ system still remain:

- no macro expansions (this one will be fixed soon I hope)
- no overloading resolution (this one is extremely hard, do not expect it soon...)
