koldo wrote on Sat, 04 October 2008 08:39Dear all

Thank you for waiting... Now it works also in Linux.

The function is:

```
Image NativeFileIcon(const char *path, bool folder)
{
#if defined(PLATFORM_WIN32)
if (folder)
    return GetFileIcon(path, true, true);
else
    return GetFileIcon(path, false);
#endif
#ifndef PLATFORM_POSIX
bool isdrive = folder && ((path == "/media") || (path == "/mnt"));
FindFile ff(path);
return isdrive ? PosixGetDriveImage(ff.GetName())
               : GetFileIcon(path, ff.GetName(), folder, ff.GetMode() & 0111);
#endif
}
```

It is also necessary to add this in FileSel.h

```
#if defined(PLATFORM_WIN32)
Image GetFileIcon(const char *path, bool dir, bool force = false)
#endif
#ifndef PLATFORM_POSIX
Image GetFileIcon(const String& folder, const String& filename, bool isdir, bool isexe);
Image PosixGetDriveImage(String dir);
#endif
```

And as I have explained in the first post, go to FileSel.cpp and in the definition remove "= false" from:

```
Image GetFileIcon(const char *path, bool dir, bool force = false)
```

This is only a simple patch I have found useful. But it would be great if the FileSel developer could integrate this inside the code. Thank you very much to him/her.

Best regards
Koldo

Adopted as

```
Image NativePathIcon(const char *path, bool folder)
```

```

{
#if defined(PLATFORM_WIN32)
if (folder)
    return GetFileIcon(path, true, true);
else
    return GetFileIcon(path, false);
#endif
#ifndef PLATFORM_POSIX
bool isdrive = folder && ((path == "/media") || (path == "/mnt"));
return isdrive ? PosixGetDriveImage.GetFileName(path)
    : GetFileIcon(path, GetFileName(path), folder, ff.GetMode() & 0111);
#endif
}

Image NativePathIcon(const char *path)
{
    FindFile ff(path);
    return NativePathIcon(path, ff.IsFolder());
}

```

(BTW, is my simplified GetFileName solution correct or was there any other idea why have you used FindFile?).

Mirek
