I've noticed that progress stuff don't work well when posting big files; the progress function is never called when sending the data.

So, with a small change that can be arranged; in httpcli.cpp, around line 182 :

```
int nwrite = socket.WriteWait(request.Getlter(written), request.GetLength() - written, 1000);
```

can be replaced with

```
int nwrite = socket.WriteWait(request.Getlter(written), min(request.GetLength() - written, 1000), 1000);
```

So the progress gate is called every 1000 Bytes sent. That gives a very smooth progress bar behaviour when sending files via post method.

Ciao

Max
