sergeynikitin wrote on Sun, 02 November 2008 10:54I have a huge table 50000-100000 records. It involves 12-15 reference tables. This is stored in the MySQL server.

What kind of technology would you recommend to work with the database.

Will all the data loaded into memory or the client program will be loaded only a fraction?

Loading it all would make your app working very slow. In my current app (Postgres) I use offset limit to page data. And of course I implemented special toolbar for navigating:

In SqlServer you can use OVER and ROW_NUMBER() to do the same.
