sergeynikitin wrote on Sun, 02 November 2008 10:54I have a huge table 50000-100000 records. It involves 12-15 reference tables. This is stored in the MySQL server.

What kind of technology would you recommend to work with the database.

Will all the data loaded into memory or the client program will be loaded only a fraction?

Just a funny note: I have just tried what it takes to fetch 130000 records to ArrayCtrl.

It is about 400MB.

Therefore, I would recommend trying the simple path first - do not worry and try it. Maybe the table is not as huge as you think.

You know it, "premature optimization..."

(Well, it definitely is not a huge table. The biggest table I am regulary dealing with has 2 500 000 records
