Subject: Execute(), LPARAM and WPARAM
Posted by amando1957 on Thu, 13 Nov 2008 17:50:46 GMT

Hi to all,

I tried an event handler like this:

```
class midi_in : public Withmidi_inLayout<TopWindow>
{};

GUI_APP_MAIN
{
 midi_in inApp;
 // "lpGot" is just a dummy:
 LPARAM lpGot;

 for(;;)
  switch(inApp.Execute())
  {
  // for this I need the LPARAM and WPARAM:
  case MM_MIM_DATA:
   inApp.getMidiInData(lpGot);
   break;
  case WM_KEYDOWN:
   PromptOK(t_("Want to quit proggy?"));
   return;
  }

 inApp.Run();
}
```

How can I read the LPARAM and WPARAM values now?
Are there any get-functions?

Martin
