cbpporter wrote on Sun, 23 November 2008 11:39Well there is one small problem: some function names get overridden with a different name. For example, Upp::GetModuleFileName becomes Upp::GetModuleFileNameA. This is because of the macros from windows.h, which happily traverse namespace borders. I don't know if this can pose a problem, but it could give rise to surprises when linking.

Yes, I am aware about that. IMO, it is not really a problem.
