Subject: MSSQL strange problem and ugly workaround patch...
Posted by mirek on Mon, 24 Nov 2008 17:47:59 GMT

I have found a very strange problem with MSSQL:

When fetching @@IDENTITY column while inside doing inserts inside select/fetch loop, I am getting Nulls until the last portion of data passed from MSSQL and client (in Prefetch routine).

Something like:

```
Sql sql;
sql * Select(...).From(...);
while(sql.Fetch()) {
    SQL * Insert(...) // table has INDENT columne
    DUMP(SQL % Select("@@IDENTITY"));
}
```

Really weird. I have not authored OleDB and I am a little bit lost in all those Ole interfaces, but I see nothing particulary wrong there anyway. Other selects work just as expected, just this one if wrong.

I have found a working workaround using IDENT_CURRENT('tablename'). Of course, it requires the name of table to be stored, so we have to look into statement executed if it is insert and what is after 'into'. Anyway, seems to fix the issue....
