- bump -

Both bugs haven't been solved in the latest svn yet. The Agent header typo and the chunked-gzipped content(see prev. post for fixes).

I also found out the memory leak is not caused by Ultimate++ but openssl itself, apparently this is a known bug. The use of NTL memory manager just brings it forward. Also this only happens when you exit a program, so it really isn't that big of a problem.

Although I would still recommend commenting it for now, until openssl comes with a fix(quite possibly a library_unload function).
