On the other hand, the unrelated problem with uneven colors in Xerox Phaser 6200, might have something to do with color spaces being different for images and vector elements causing weird color effects. I have no proof of this, but still, the printout gets corrected when this optimization is commented out.

Something simple to try: Create uniform color Image (e.g. using `CreateImage(Size sz, Color color)`) then print it alongside the Rect with the same color.

Mirek
