1. [http://upp.sourceforge.net/src\\$CtrlCore\\$Ctrl\\$en-us.html](http://upp.sourceforge.net/src$CtrlCore$Ctrl$en-us.html)

Note that you cannot convert int to logc for the simple reason - it contains in fact 3 fields... Logc should stand for "logical coordinate" or "logical component". Vertical and horizontal Logc form LogPos - placement of Ctrl within its parent.

2. Logc is simply a different beast....
