I have several localized texts in src.tpp and would like to load them in run-time according to the current user language.

The easiest way I can think of, is to do it with a code like this:

PromptOK(String("MyProject/src/About\$") + GetLanguageCode(GetCurrentLanguage()));

And a function GetLanguageCode() is a slightly modified LNGasText():

String GetLanguageCode(int d)

```
{  
    String result;  
    int c = (d >> 15) & 31;  
    if(c) {  
        result.Cat(c + 'a' - 1);  
        c = (d >> 10) & 31;  
        if(c) {  
            result.Cat(c + 'a' - 1);  
            c = (d >> 5) & 31;  
            if(c) {  
                result.Cat('-');  
                result.Cat(c + 'a' - 1);  
                c = d & 31;  
                if(c) result.Cat(c + 'a' - 1);  
            }  
        }  
    }  
    c = (d >> 20) & 255;  
    return result;
```

}The change is that it does not add charset name and returns lower-case language code, exactly as TPP editor set language codes for topics.

Am I inventing a wheel?
