Hm, did you update your png.upp file? If yes I think you have to manually rebuild the png package because TheIDE doesn't recognize the change.

Quote:

(which reminds me that SDraw does not work in Linux now - needs minor text rendering related fix).

Text rendering is also the problematic part of cairo, currently there is just support for the "toy api" in my implementation. YOu shouldn't really use it in real projects. The best option would be pango, but that would be again another library and the license is probably not that great for U++. LGPL.
