I have also used embedded Python much in a very large project. It wasn't used with a gui though, just command line. I used the Paramiko SFTP module to provide as SFTP server and client as well as using Python as a way to extend the application's functionality (to perform data transformations). I also used Py2Exe to package the entire interpreter along with the program. My memory footprint was not over 10 MB and performance was good, and it was running in a Virtual Box VM.

I'll post some of the code when I get a chance again.

Just be careful with threading and embedded python, it can get tricky.
