Ah, I made a mistake. The code should be:

```
// Add our child docking window!
DockTop(Dockable(subdock, "Child DockWindow").SizeHint(Size(300, 400)));
subdock.DockTop(subdock.Dockable(arrayctrl2, "ArrayCtrl 2").SizeHint(Size(300, 200)));
subdock.DockRight(subdock.Dockable(treectrl2, "TreeCtrl 2").SizeHint(Size(300, 200)));
```

Because the Dockable function registers the ctrl with the window it must be called using on the DockWindow you wish to own it, otherwise at some point there will be problems

The Docking configuration window only applies to a single DockWindow instance.
