I've added tab stacking to the TabBar class now:

The screenshot shows a TabBar-derived QuickTabs that has the same class interface as the ide package, so in theory could replace it.

Clicking on a tab cycles through the stacked tabs. Adding buttons (or more likely hyperlink-style text) for the stacked tabs requires a bit more work, but may be possible. I'd also like to modify the appearance of the stacked tabs so that you can see the tabs 'behind' them, but unpredictable OS themeing may make this impossible.

Excecutable in next post. I won't update the SVN version for while, since the Docking package relies on TabBar and I don't want to break it.
