Sorry, but may be I didnt explain my problem:

I drawn a form in a lay file during design time. Please, see the jpeg attached.

During form initialization (run-time) I want to select the numerica switch button and clear (it is already) the alfanumerica switch button.

The second doublt is:

On visual basic and visual C we add (at design time) switch buttons and group them and they became mutual exclusive, this means when the user selects one all the others become unselected.

Does u++ has this automatic behaviour?

I am using this but it doesnt works:

```
void xxxdlg::OnSwitch1(void) //numerica
{
    sw2<<NULL;
    sw1<<1;
}
```

```
void xxxdlg::OnSwitch2(void) //alfanumerica
{
    sw1<<NULL;
    sw2<<1;
}
```

Many thanks

Alex
