I use XML for storing settings, and even communication through sockets. But I found a weird thing, you can't put a \n in a string and then parse it back. Eventually I discovered this is because of the function DeXml() in the file Core/XML.cpp, in this part:

```
else if((byte)*s < ' ' && *s != '\n') result.Cat(NFormat("&#x%02x;", (byte)*s));
```

This should be changed to the code below.

```
else if((byte)*s < ' ') result.Cat(NFormat("&#x%02x;", (byte)*s));
```

I don't see any reason why it should not be coded.
