Great! Everything looks good. Extra padding is gone. I ran validation tests and there are still some errors, but nothing to prevent proper rendering (I hope ). While fixing validation is something to think about, I won't waste too much time with it right now.

But there are still some small improvements to the generation which I'll post. For some things you are using and verbose way and I think I can make it shorter and clear. Another thing to think about is CSS inheritance, which should make things yet again clear.

Quote:Issue #002. The code reference window used to show little icons for documented items.

With new changes, this feature was lost, but it still works for public functions, but not class members. So either make it work for everything, or remove it completely.

The problem is that you are not setting the scope field properly. Adding:

`m.scope = scope;`

to `ide\Browser\CodeBrowser.cpp` around line 187 seems to do the trick. Maybe you can find better fix.
