Subject: How to combine two widget-class in the topwindow

Hello,

after your precious feedback I was able to build a marvellous menubar with many menu. It is very easy.

Now the problem (for me) is how to combine two o more classes.
Let me refer to a concrete case. In the reference assembly we have the packages Menu and StatusBar. In the first one I found the class App for the menu, while in the second one I have the class App2 (actually named App too) for the status bar.
The silly question is: How to let appear in one top window the menu and the status bar?

I have put in one file both code and tried the stupid

```
GUI_APP_MAIN
{
 App().Run();
 App2().Run();
}
```

that opened two separate top windows (two different applications). I was not luckier with Open() method.

Many thanks in advance,
Luigi
