I was finished first variant of Google Translator in u++.

It seems nice... but i don't know how to resolve:

1. Problems with char encode, (for example when i translate from English to Russian)?
2. Set progress bar on execute http.
3. Integrate user suggestion to improve Google Translator Dictionary!

I can continue to develop:

1. Parse dictionary when i translate only an word.
2. Cash translated terms in xml file.
3. Languages icons.

I attached the source code of GoogleTranslator!

Any ideas is welcome!
