PacomEngineer wrote on Thu, 30 March 2006 20:42 When running attached application and the help button is pressed the program crashes.

Using the Topic++ editor the help file is edited fine.

Using the Topic browser the table fails to show the left column of the table.

Note it is important to use the full path as provided. ie MyApp should contain directory Bugs with HelpBug under it.

If not then it will not crash, although it will still fail to show anything.

Crashing fixed.

However, the real problem is that you should add VectorDes package to display content of that image. (Please also expect some changes there, we are not happy about VectorDes too much now). The bug was about dealing with non-existent format.
