U++ is using a rolling release system which means that the developers are working always on dev branch and if there is a bug it get always solved but not back ported to say 2008.1. Usually a new release come out after some major changes and it's out for people who are "scared" about using latest changes . I don't see why someone would stay with U++ 2008.1 or other release. Using U++ from development branch doesn't break your application(too often) and make you keeping the step with the changes which are introduced daily. My advice is to don't be afraid of using latest U++ from svn. And yes, i think there should be a new release for 2009 year and i think Mirek is thinking at that too (U++ PR, server infrastructure, etc.)
