Linux/KDE has an issue with searching Help;

Based on advise, I used a workaround by commenting out line 55 in Help.cpp

I need now to find the root cause of this bug, and to do this

I want to debug theide and whatever else it uses.

I have a copy of svn.1055

How do I make this into an editable/debugable package so that

I can use theide to debug this package (itself, basically)?

I'd rather post solutions to problems I encounter in upp, than
to always be asking for help. Help me with this, and changes
are that I will be able to help others in the future.

TIA
