JoseB wrote on Wed, 15 April 2009 11:30Hi,
I am planning an upp aplication that will have a service for running in windows xp and a GUI console to administer that service. The service will use SQLite database. During execution will be the change that service is reading from database table and console is adding or editing records.
Does SQLite database supports this?
If not, which FREE database are you using for multiuser/multiprocess?

Thanks

JoseB

As long as you keep one session per one thread, I think you should be OK.

(More threads per one session are OK too, but you need to serialize then).
