Subject: GridCtrl column width simple question

Hello all

I have done a simple function to write data to a GridCtrl:

```
void Grid_Write(int row, int col, char *str)
```

When the row or the column does not exist, it does:

```
if (row > grid.GetRowCount()-1) {  
    for (int i = grid.GetRowCount(); i < row+1; ++i)  
        grid.AddRow("", 100);  
}
```

Doing that with more than one column I get this: the first columns get so thin that are almost hidden.

Do you know how to get all columns with same width if they - as in this case - are not added to the grid at the same time and data is included in between?

Best regards  
Koldo
