Subject: GridCtrl column width simple question
Posted by koldo on Wed, 29 Apr 2009 08:30:08 GMT

Hello all

I have done a simple function to write data to a GridCtrl:

void Grid_Write(int row, int col, char *str)

When the row or the column does not exist, it does:
```
 if (row > grid.GetRowCount()-1) {
  for (int i = grid.GetRowCount(); i < row+1; ++i)
   grid.AddRow("", 100);
 }
```

Doing that with more than one column I get this: the first columns get so thin that are almost hidden.

Do you know how to get all columns with same width if they - as in this case - are not added to the grid at the same time and data is included in between?

Best regards
Koldo
