Maybe you can commit it as branch for now...
Maybe I could work on it a bit too...

I somehow overlookd your answer..
Yes, I'll do so - it's in acceptable stage now.

add searching for file in files panel. It's very hard to find anything when package has lot of files.

I guess this is now ok with new navigator, right?

Mirek

Yes and no In navigator the problem is that klikcing on a file in top part of navigator doesn't activate this file. I have to click on a method from bottom part of navigator.

I was thinkg lately about navigating and this is what I do:

to find a method in current file I press CTRL-G (F2 in my ide)

to find if a method exists I use navigator.

I'm almost never intrested of listing all class methods. Code+space should show me possible options.

That is why I would remove top part of navigator with files and packages and integrate it with the bottom part. When you click at found file in navigator this file should be open. When you click on method you should be taken to this method and optionally help in the bottom part of navigator should be open for that method (otherwise there is no bottom part).

Next to find text box I would add one more switch - to activate / deactivate class view. In class view we should have two panels - top one with class names that matches search criteria and bottom with all methods listed for this class.

Ctrl-G and Ctrl-J would just open navigator in a dialog window and with preselected filter (as it is now - global search or local) or I would even make it one with global scope.

And last thing - Alt - J should be possible with Ctrl + LMB.

Then navigation in ide would be excelent
