
Subject: how to solve? (add compiler option -> solved)

Hi,

I've two packages in located in the same assembly

packageA for whole project

packageB for testing one part of the project which is developed and tested here, but finally used in packageA

there are a few includes which I don't want to use in packageB, but I need in packageA in files of packageB.

I can write
`#define xyz`

and
`#ifndef xyz`
...
`#else`
...
`#endif`

in each file, but I have to modify "`#define xyz`" each time in all the files when I want to build packageA.

Any idea how to solve this? I tried to set a global flag in the package organizer, but it didn't work.

regards

reinhard
