Hi

Does GridCtrl have the ability to remember the width/height of individual columns/rows?  If not, is there a way to get notification of these things being changed so the settings can be saved and restored or to iteratively save & restore.

Can individual cells in GridCtrl contain controls such as check-boxes or combo boxes or bitmaps?

Is it possible for an individual cell to hold wrapped text (i.e. multiple lines) like in excel?

What are the main differences between GridCtrl and ArrayCtrl?

BTW - in GridCtrl homebudget example about box it says "coping, distributing or using without a valid license is deprecated".
  - "coping" should be copying, and what does deprecated mean??

TIA
Graeme
