Sorry,sorry,so sorry to keep asking...

In both case you've described,I fully understood the point.My problem is that in the designer I create a button ,and I gave it a name (in column "variable/id?") *btnOK*.Then I change to head file and cpp file where there is no such a variable named btnOK inside the entire file,no only any classes,so how can I call

btnOK=callback(btnOKClick);//where is variable *btnOK*?

This is the problem I met.
Thanks a million.

Regards,
Sam
