Hello mr\_ped

If you use Ubuntu and you can not install the full OS there is one additional option to VirtualBox or other virtualization system. It is called Portable Ubuntu.

<http://portableubuntu.demonccc.cloudius.com.ar/>

It is an Ubuntu system running as a Windows application. You do not need to install it, just run it so it is easy to carry in an usb memory. All Ubuntu applications appear on the Windows desktop.

Using it from an XP I have compiled the last theide from an older one that was in a 32 bits .deb package, just like I did in the real Ubuntu.

I do know that there is no better GNU/Linux than the real one, but in special cases this could be another option and U++ works well in it.

Best regards

Koldo
