Subject: Watching global variables in IDE debugger with MSC7-1

Hi

I'm trying out the debugger in the IDE with MSC7.1 build and when I try to add a watch for a global variable it says the variable is undefined. It shows me local variables ok.

If I fire up the V Studio debugger from TheIDE with "devenv" I can add the global variable to the watch list ok (though I seem to be forced to create a "solution" file).

The global variable is just a simple DWORD variable.
Any ideas why The IDE says it's "undefined" - I checked the name carefully? I could use devenv but I'm just wondering if this should work.

Graeme
